

CRT 9

1. Index value = 2
2. `int[] quantities = new int [20];`
3. `double[] heights = {1.65,2.15,4.95};`
4.

```
for (int grade : grades)
{
    System.out.println(grade);
}
```
6. Entire array: Passing a reference to the array, the method can only modify the actual contents of the original array.
Single element: is passed by value, the method receives a copy of the value, anything changed inside the method doesn't affect the original array.
7. They are needed when the position you want doesn't match the zero index based array.
8. Output displayed = i
10. A dynamic array like an ArrayList is better when the number of elements isn't known. Dynamic arrays change in size during run time and are used in applications where the size of the array may need to grow or shrink.
11. The `ArrayList.indexOf()` method determines the equality by looking through the list and using `.equals()` to compare the object to each element.
12. They can be compared using `.equals()` which compares the values that are inside the object.
